GCP Capstone-Project COMPLETED by Nagesha KS

Please check the following screenshots for each question.

You work as a Cloud Engineer in XYZ Corporation. The company has recently set up a new cloud team, and wants them to work on the company's Google Cloud Console.

There are three roles in the team:

- Admins - owner access
- Workers - edit access for VMs
- QA - viewer access for VMs

Create three users for the same.

There is a **separate project QA where a storage server** is running.

In the current architecture, the company is running a single server which is high in config for their application needs.

You have been hired to make the architecture more resilient and cost effective. For implementing the same, following are the changes that you suggested:

1. Deploy the application on app service which can be scaled up and down from 2 instances to 10 instances.
Use apache tools for this for creating traffic for the server.
2. A storage server was deployed in a different project. You have to ensure the app service is able to talk to that server.
To ensure this, deploy a server in the same VPC as of app service, and check if you are able to ping storage VM in another project.
3. The app service will be interacting with a database. For now, the database exists in a local system. Here is the exported database.
<https://drive.google.com/file/d/15A9HC0wHDKDigGFoyFJVALEkLn095GmE/view?pli=1>
Use this and import in Cloud SQL. The ZIP files have been downloaded here.
4. The company wants to review different versions of the code on the app service. Explain the mechanism using screenshots.
5. Configure Stackdriver monitoring to monitor the storage server. An email should be triggered to the owner of the project in case this server goes down.

The above architecture and requirements have to be shown to the stakeholders using a proof of concept.

Please implement the project and submit screenshots to the support team.

The screenshot shows the Google Cloud IAM console for the project 'Nagesha-Sample-Company'. The left sidebar contains navigation links for IAM and admin, IAM, PAM, Principal access bound..., Identity and organisation, Policy troubleshooter, Policy analyser (marked as New), Organisation policies, Service accounts, Workload Identity Fede..., Workforce identity fede..., Labels, Tags, Manage resources, and Release notes. The main content area is titled 'Permissions for project Nagesha-Sample-Company' and includes tabs for ALLOW, DENY, and RECOMMENDATIONS HISTORY. Below the tabs, there's a section for 'GRANT ACCESS' and 'REMOVE ACCESS'. A table lists the granted access for three principals:

Type	Principal	Name	Role	Security insights
<input type="checkbox"/>	nag9516@gmail.com		Editor	
<input type="checkbox"/>	nag95kst@gmail.com		Viewer	
<input type="checkbox"/>	nagesha.ks@gmail.com	Nagesha K S	Owner	

A notification at the bottom states 'Policy updated'. On the right, there's a 'Recommended for you' section with links to IAM overview, Grant an IAM role using the Google Cloud console, Choose predefined roles, and Basic and predefined roles reference.

Create a MySQL instance

Zonal availability

☒ Single zone

In case of outage, no failover. Not recommended for production.

☐ Multiple zones (highly available)

Automatic failover to another zone within your selected region. Recommended for production instances. Increases cost.

SPECIFY ZONES

Customise your instance

You can also customise instance configurations later

The screenshot displays the Google Cloud Monitoring console for the project 'Nagesha-Sample-Company'. The left sidebar shows navigation options like 'Observability Monitoring', 'Overview', 'Dashboards', and 'Explore'. The main content area is titled 'Uptime checks' and shows a table of checks. One check, 'sample-uptime', is listed with status indicators for 'Asia Pacific', 'Europe', 'North America', and 'South America'. The right sidebar provides 'Recommended for you' links, including 'Synthetic monitoring overview', 'Quickstart', and 'Use cases for Monitoring'. The bottom of the screen shows a Windows taskbar with various application icons and the system clock indicating 20:11 on 12-10-2024.

VM Instance down

1

We recommend that you create multiple notification channels for redundancy purposes. Google has no control of many of the delivery systems after we have passed the notification to that system. Additionally, a single Google service supports Cloud Console Mobile App, PagerDuty, Webhooks, and Slack. If you use one of these notification channels, then use email, SMS, or Pub/Sub as the redundant channel.

The screenshot shows the Google Cloud Monitoring console. The left sidebar contains navigation options: Observability Monitoring, Overview, Dashboards, Explore (Metrics explorer, Logs Explorer, Log Analytics, Trace explorer), and Detect (Alerting, Error reporting, Uptime checks). The main content area displays the 'Policy details' for an alert policy named 'VM Instance down'. The policy is 'Enabled' and has a 'Severity' of 'No severity'. The condition is 'VM Instance - CPU usage' with a 'Threshold' of 1. The policy is set to trigger when the CPU usage crosses the threshold. The policy is saved, as indicated by the 'Alert policy VM Instance down saved' message at the bottom.

Commands

Created project "Nagesha-sample company"

Created Users and Assigned Roles

Go to **IAM & Admin > IAM > Grant Access > Add**

Assigned the Owner role to the Admin

Assigned the Compute Engine Editor role to the Worker

Assigned the Compute Engine Viewer role to the QA team member

Deployed Application on App Engine (Scalable Service)

Created an app.yaml file for App Engine configuration:

```
sudo nano app.yaml
```

yaml

```
runtime: python39 # Example using Python
```

```
automatic_scaling:
```

```
  min_instances: 2
```

```
  max_instances: 10
```

gcloud app deploy

Enabled Communication with Storage Server

Created a VM Instance in the Same VPC:

Go to **Compute Engine > VM instances**.

Ping Storage Server:

```
ping <STORAGE_SERVER_IP>
```

```
ping 34.67.175.174
```

Imported Database into Cloud SQL

Created a Cloud SQL Instance:

Go to **SQL > Create Instance > MySQL > named as sample-db**

Imported the Database:

Downloaded the ZIP file to my local drive and extracted the database.

Done through Dashboard as well as **gcloud command** to import the SQL dump into Cloud SQL:

```
gcloud sql import sql <INSTANCE_NAME> gs://<BUCKET_NAME>/<DATABASE_FILE>
```

```
gcloud sql import csv small-20241012-141049 gs:// sampl-db-file/ FL_insurance_sample
```

Managing App Versions on App Engine

Go to **App Engine > Versions**

```
gcloud app deploy --version v2
```

Configured Monitoring with Stackdriver

Go to **Monitoring > Create Workspace**.

Created Uptime Check:

Go to **Monitoring > Uptime checks**.

Created Alerting Policy:

Go to **Monitoring > Alerting > Create Policy**.

Set a condition for "Cloud storage and message as "VM Instance down".

Set notification to send an email to the project owner's email id: Nagesha.ks@gmail.com
