DevOps Project : Capstone 1 COMPLETED by Nagesha KS

Please check the following screenshots for each question.

You have been hired as a Sr. DevOps Engineer in Abode Software. They want to **implement DevOps Lifecycle** in their company.

You have been asked to implement this lifecycle as fast as possible.

Abode Software is a product-based company and their product is available on this **GitHub link**.

<https://github.com/hshar/website.git>

Following are the specifications of the lifecycle:

1. Install the necessary software on the machines using a **configuration management tool - Ansible**
2. **Git workflow** has to be implemented
3. **CodeBuild** should automatically be triggered once a commit is made to master branch or develop branch.
 - a. If a **commit** is made to **master branch**, **test** and **push to prod**
 - b. If a **commit** is made to **develop branch**, just **test the product**, **do not push to prod**
4. The **code should be containerized** with the help of a **Dockerfile**. The Dockerfile should be built every time there is a **push to GitHub**.

Use the following pre-built container for your application: **hshar/webapp**

The code should reside in **'/var/www/html'**

5. The above tasks should be defined in a **Jenkins Pipeline** with the following jobs:
 - a. Job1 : build
 - b. Job2 : test
 - c. Job3 : prod

Getting Started

Instance Configuration

Jenkins URL:

The Jenkins URL is used to provide the root URL for absolute links to various Jenkins resources. That means this value is required for proper operation of many Jenkins features including email notifications, PR status updates, and the `BUILD_URL` environment variable provided to build steps.

The proposed default value shown is **not saved yet** and is generated from the current request, if possible. The best practice is to set this value to the URL that users are expected to use. This will avoid confusion when sharing or viewing links.

Dashboard > Manage Jenkins > Nodes > New node

New node

Node name

Prod server

Type

☐ Permanent Agent

Adds a plain, permanent agent to Jenkins. This is called "permanent" because Jenkins doesn't provide higher level of integration with these agents, such as dynamic provisioning. Select this type if no other agent types apply — for example such as when you are adding a physical computer, virtual machines managed outside Jenkins, etc.

☒ Copy Existing Node

sample-job

Select an item type

**Freestyle project**

Classic, general-purpose job type that checks out from up to one SCM, executes build steps serially, followed by post-build steps like archiving artifacts and sending email notifications.

**Pipeline**

Orchestrates long-running activities that can span multiple build agents. Suitable for building pipelines (formerly known as workflows) and/or organizing complex activities that do not easily fit in free-style job type.

**Multi-configuration project**

Suitable for projects that need a large number of different configurations, such as testing on multiple environments, platform-specific builds, etc.

Test job

Select an item type

 **Freestyle project**
Classic, general-purpose job type that checks out from up to one SCM, executes build steps serially, followed by post-build steps like archiving artifacts and sending email notifications.

 **Pipeline**
Orchestrates long-running activities that can span multiple build agents. Suitable for building pipelines (formerly known as workflows) and/or organizing complex activities that do not easily fit in free-style job type.

 **Multi-configuration project**
Suitable for projects that need a large number of different configurations, such as testing on multiple environments, platform-specific builds, etc.

OK

Dashboard > All > New Item

**Folder**
Creates a container that stores nested items in it. Useful for grouping things together. Unlike view, which is just a filter, a folder creates a separate namespace, so you can have multiple things of the same name as long as they are in different folders.

**Multibranch Pipeline**
Creates a set of Pipeline projects according to detected branches in one SCM repository.

**Organization Folder**
Creates a set of multibranch project subfolders by scanning for repositories.

If you want to create a new item from other existing, you can use this option:
